

"The environment and quality policy followed by MAXY, explained to the interested parties"

OUR ENVIRONMENTAL AND QUALITY POLICY:	SOME EXPLANATIONS :
<p><i>Catch every opportunity to improve our environmental and quality management system, thanks in particular to a systematic organization of feedback and their exploitation.</i></p>	<p>We have a well-established system, procedures and controls that avoid product defects and limit our environmental impacts. But no question of resting on our laurels! Thanks to feedback and regular internal audits, we constantly improve our practices.</p>
<p><i>Keep us informed of developments in regulatory and normative requirements and regularly ensure that our activities and equipment comply with these requirements.</i></p>	<p>Perhaps no one is supposed to ignore the law, but nowadays, to know what is allowed and what is forbidden, monitoring and assessment of regulatory compliance are essential activities. We make this effort, out of respect for the society in which we live.</p>
<p><i>For the environment, to carry out a systematic study of the environmental impacts that our activity, operational failures, and our products can generate, and implement prevention actions for each significant risk identified.</i></p>	<p>Zero risk, zero impact on the environment, do not exist. But by already addressing the most significant risks and impacts, evaluated with a recognized method, we can improve our environmental performance without degrading economic performance.</p>
<p><i>Monitoring of the implementation of this policy is ensured by means of quantified targets assembled in an environmental quality scorecard, reviewed twice a year by management.</i></p>	<p>By setting numerical targets, progress can be monitored more objectively. And since management is very attentive to the results concerning product quality and environmental performance, the motivation of each one on these subjects is naturally energized.</p>
